Linkedin: <https://www.linkedin.com/in/brian-wahungu-9387093ba/>

Github: <https://github.com/BrianWahungu>

My Portfolio: <https://wahungubrian.netlify.app/>

About Me:

As a full-stack software engineer, I not only craft user-friendly UI/UX designs, but I also craft API endpoints and backend systems that support the functionality of the application that I am building. I am proficient in different languages for the front end, including JavaScript and TypeScript. I also specialize in frameworks such as React, Next, and Angular for front-end development. As for backend development, I specialize in frameworks such as Express, Node, Ruby, Ruby on Rails, and also integrate databases using MongoDB and Postgres. Last but not least, I am efficient when it comes to DevOps and use Git as my way of Version Control. I also incorporate cloud services that I use to deploy my applications, including Vercel, Render, and Netlify.

Positions:

At the moment, I still do not have any experience working with a real organization, but I am looking to land my first role and make a tremendous impact. All the same, I have immersed myself in code alongs that have been inspired by senior developers on YouTube. This has enabled me to understand the languages of the internet and also comprehend how full-stack applications are built. From the Figma Designs to the front-end development to the backend development. I am looking to land my first role and have an impact on the given organization.

Skills:

- Frontend Development - HTML, CSS, JS, React, Angular, Next, Vue.
- Backend Development - Ruby, Ruby on Rails, Python, Node, Express, MongoDB, Postgres.
- DevOps - Git, GitHub, Render, AWS, Azure, Netlify, Vercel.

Education:

School: Moringa School

Level: Certification

Course: Software Engineering

Duration: 6 Months (Bootcamp style)

Period: November 2022 - June 2023.

Projects:

My lack of experience with an organization has been replaced by different projects, including hackathons and code-alongs. Here are some of my best projects.

Project 1: By Grace's Application

Affiliation: Moringa School Learning

Github Link: <https://github.com/BrianWahungu/By-Graces>

My Role: Acted as the scam master, ensuring that there was easy integration of the code from different individuals using GitHub. I managed all the pull requests and ensured that all the code was integrated into one full application. I served as the **DevOps** for this project, whereas other team members worked on the UI / UX design.

Project 2: Food Del App

Affiliation: Great Stack

Github Link: <https://github.com/BrianWahungu/food-del>

My Role: My role was simply following the code, which was about eight hours, where I did everything that the tutor did, and I achieved the same results. This showcases my ability to follow instructions keenly and achieve results through the guidance of other senior engineers in the organization and in the industry. This also showcases my ability to build full-stack applications, given that this is a full-stack web application.

Hackathons:

I have been involved in different hackathons, including:

- Moringa School, in partnership with the Kenya Association of Manufacturers (KAM)
- Llama Impact Hackathon held in Kigali, Rwanda, organized by Afri Labs in partnership with the Melinda and Gates Foundation.
- ICP Hackathon held at the University of Nairobi.
- PesaLink Hackathon held at Strathmore University.

Referees:

Available upon request.
